

# DATA ABSTRACTION

## Points to remember:

- Abstract Data type (ADT) is a type (or class) for objects whose behavior is defined by a set of value and a set of operations.
- The definition of ADT only mentions what operations are to be performed but not how these operations will be implemented.
- ADT does not specify how data will be organized in memory and what algorithms will be used for implementing the operations
- Constructors are functions that build the abstract data type.
- Selectors are functions that retrieve information from the data type.
- Concrete data types or structures (CDT's) are direct implementations of a relatively simple concept.
- Abstract Data Types (ADT's) offer a high level view (and use) of a concept independent of its implementation.
